

Efficient Detection of Exchangeable Factors in Factor Graphs

DFKI Labor Lübeck Meeting

Malte Luttermann

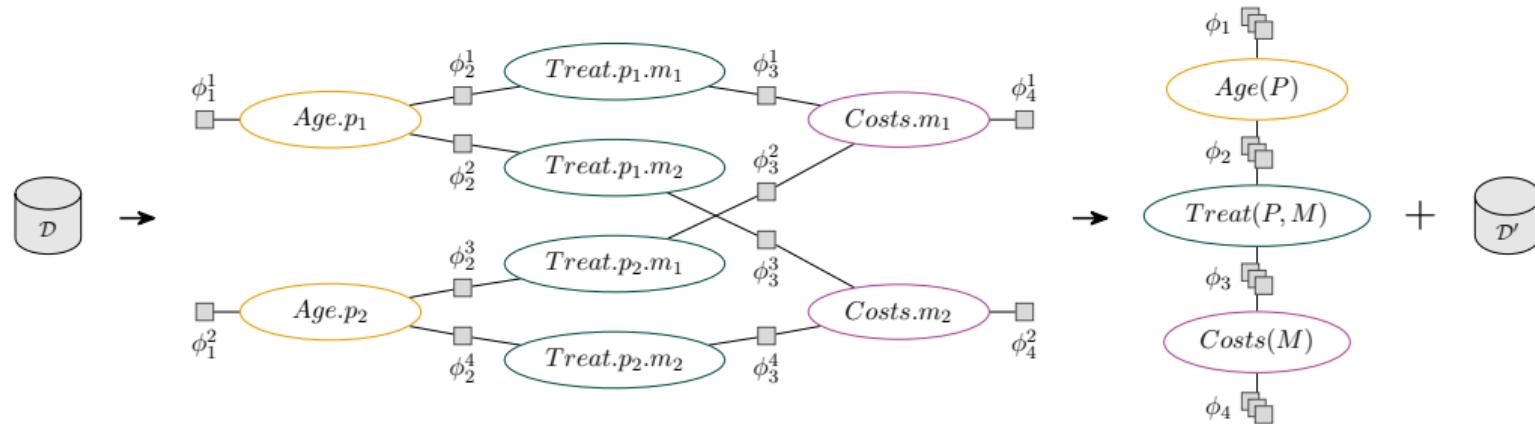

German Research Center for Artificial Intelligence (DFKI)

July 16, 2024

Motivation

Pipeline to generate synthetic relational data via probabilistic relational models:

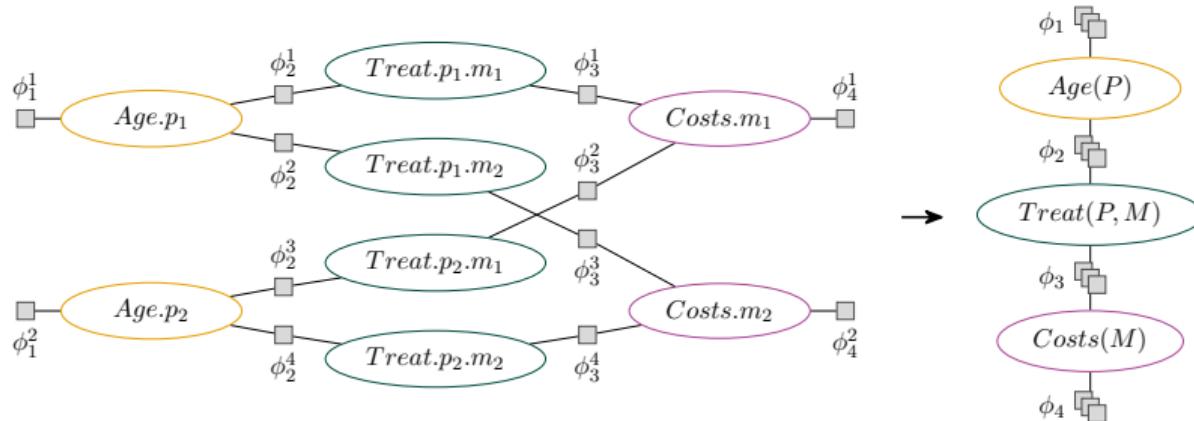

1. Construction of a factor graph
2. Transformation of the factor graph into a parametric factor graph
3. Sampling the parametric factor graph to generate synthetic data samples

Motivation

Pipeline to generate synthetic relational data via probabilistic relational models:

1. Construction of a factor graph
2. Transformation of the factor graph into a parametric factor graph
3. Sampling the parametric factor graph to generate synthetic data samples

Problem Setup I

- ▶ Goal: Efficiently detect exchangeable factors
- ▶ Exchangeable factors encode an equivalent probability distribution

The diagram illustrates the factorization of a joint distribution $P(A, B, C)$ into two components: $P(R(X), B)$ and $P(B | R(X))$.

On the left, a graphical model shows nodes A, B, and C. Node A is connected to B via an edge labeled ϕ_1 . Node B is connected to C via an edge labeled ϕ_2 . The joint distribution $P(A, B, C)$ is factored into $P(R(X), B)$ and $P(B | R(X))$.

Below the model, two tables show the factor distributions:

A	B	$\phi_1(A, B)$
true	true	φ_1
true	false	φ_2
false	true	φ_3
false	false	φ_4

C	B	$\phi_2(C, B)$
true	true	φ_1
true	false	φ_2
false	true	φ_3
false	false	φ_4

An arrow points from the factor distributions to the right table:

$R(X)$	B	$\phi'_1(R(X), B)$
true	true	φ_1
true	false	φ_2
false	true	φ_3
false	false	φ_4

Problem Setup II

- ▶ Goal: Efficiently detect exchangeable factors
- ▶ Exchangeable factors encode an equivalent probability distribution

A	B	$\phi_1(A, B)$
A	true	φ_1
	false	φ_2
	true	φ_3
	false	φ_4
C	B	$\phi_2(C, B)$
B	true	φ_1
	false	φ_2
	true	φ_3
	false	φ_4

Diagram showing a directed acyclic graph (DAG) with nodes A, B, and C. Node A has an edge to node B. Node B has edges to both nodes C and A. Node C has an edge to node B. This structure represents the joint probability distribution $P(A, B, C) = \phi_1(A, B) \phi_2(C, B)$.

A	B	$\phi'_1(A, B)$
A	true	φ_1
	false	φ_2
	true	φ_3
	false	φ_4
B	C	$\phi'_2(B, C)$
B	true	φ_1
	false	φ_3
	true	φ_2
	false	φ_4

Diagram showing a directed acyclic graph (DAG) with nodes A, B, and C. Node A has an edge to node B. Node B has an edge to node C. This structure represents the joint probability distribution $P(A, B, C) = \phi'_1(A, B) \phi'_2(B, C)$.

Previous Work and Our Contributions

Previous work (Luttermann, Braun, et al., 2024):

- ▶ Advanced Colour Passing algorithm to construct a lifted representation
- ▶ *Buckets* to prune the search space, then iterating over all argument permutations
- ▶ Number of iterations in the worst-case for a factor with n arguments: $O(n!)$

Malte Luttermann, Tanya Braun, et al. (2024). »Colour Passing Revisited: Lifted Model Construction with Commutative Factors«. *Proceedings of the Thirty-Eighth AAAI Conference on Artificial Intelligence (AAAI-2024)*. AAAI Press, pp. 20500–20507.

Previous Work and Our Contributions

Previous work (Luttermann, Braun, et al., 2024):

- ▶ Advanced Colour Passing algorithm to construct a lifted representation
- ▶ *Buckets* to prune the search space, then iterating over all argument permutations
- ▶ Number of iterations in the worst-case for a factor with n arguments: $O(n!)$

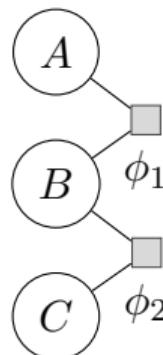

Our contributions:

- ▶ Theoretical guarantees: *Buckets* to avoid iterating over permutations if possible
- ▶ Practical algorithm: Detection of Exchangeable Factors (DEFT) algorithm
- ▶ Number of iterations in the worst-case for a factor with n arguments: $O(d)$ with $d \ll n!$ in many practical settings

Malte Luttermann, Tanya Braun, et al. (2024). »Colour Passing Revisited: Lifted Model Construction with Commutative Factors«. *Proceedings of the Thirty-Eighth AAAI Conference on Artificial Intelligence (AAAI-2024)*. AAAI Press, pp. 20500–20507.

Buckets

- ▶ Buckets count the occurrences of specific range values in an assignment
- ▶ Each potential belongs to *exactly one* bucket
- ▶ Each bucket contains *at least one* potential

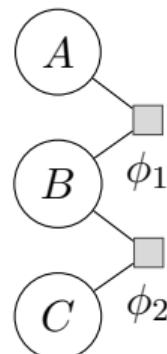

A	B	$\phi_1(A, B)$	b
true	true	φ_1	[2, 0]
true	false	φ_2	[1, 1]
false	true	φ_3	[1, 1]
false	false	φ_4	[0, 2]

B	C	$\phi_2(B, C)$	b
true	true	φ_1	[2, 0]
true	false	φ_3	[1, 1]
false	true	φ_2	[1, 1]
false	false	φ_4	[0, 2]

b	$\phi_1(b)$	$\phi_2(b)$
[2, 0]	{ φ_1 }	{ φ_1 }
[1, 1]	{ φ_2, φ_3 }	{ φ_3, φ_2 }
[0, 2]	{ φ_4 }	{ φ_4 }

Properties of Buckets I

- If at least one bucket is mapped to different multisets of values by ϕ_1 and ϕ_2 , then ϕ_1 and ϕ_2 are not exchangeable (Luttermann, Braun, et al., 2024)

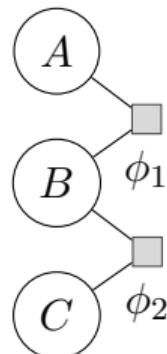

A	B	$\phi_1(A, B)$	b
true	true	φ_1	[2, 0]
true	false	φ_2	[1, 1]
false	true	φ_3	[1, 1]
false	false	φ_4	[0, 2]

b	$\phi_1(b)$	$\phi_2(b)$
[2, 0]	{ φ_1 }	{ φ_1 }
[1, 1]	{ φ_2, φ_3 }	{ φ_3, φ_2 }
[0, 2]	{ φ_4 }	{ φ_4 }

Properties of Buckets II

- ▶ Two factors are exchangeable iff there exists a permutation of their arguments such that each bucket is mapped to the same ordered multiset of values

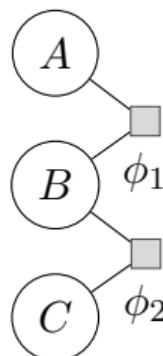

A	B	$\phi_1(A, B)$	b
true	true	φ_1	[2, 0]
true	false	φ_2	[1, 1]
false	true	φ_3	[1, 1]
false	false	φ_4	[0, 2]

B	C	$\phi_2(B, C)$	b
true	true	φ_1	[2, 0]
true	false	φ_3	[1, 1]
false	true	φ_2	[1, 1]
false	false	φ_4	[0, 2]

b	$\phi_1^{-1}(b)$	$\phi_2^{-1}(b)$
[2, 0]	$\langle \varphi_1 \rangle$	$\langle \varphi_1 \rangle$
[1, 1]	$\langle \varphi_2, \varphi_3 \rangle$	$\langle \varphi_3, \varphi_2 \rangle$
[0, 2]	$\langle \varphi_4 \rangle$	$\langle \varphi_4 \rangle$

The DEFT Algorithm

- ▶ Iterate over buckets and search for possible rearrangements to obtain identically ordered multisets within each bucket

A	B	$\phi_1(A, B)$	b
true	true	φ_1	[2, 0]
true	false	φ_2	[1, 1]
false	true	φ_3	[1, 1]
false	false	φ_4	[0, 2]

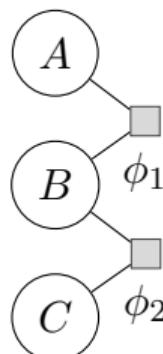

B	C	$\phi_2(B, C)$	b
true	true	φ_1	[2, 0]
true	false	φ_3	[1, 1]
false	true	φ_2	[1, 1]
false	false	φ_4	[0, 2]

b	$\phi_1^{-}(b)$	$\phi_2^{-}(b)$
[2, 0]	$\langle \varphi_1 \rangle$	$\langle \varphi_1 \rangle$
[1, 1]	$\langle \varphi_2, \varphi_3 \rangle$	$\langle \varphi_3, \varphi_2 \rangle$
[0, 2]	$\langle \varphi_4 \rangle$	$\langle \varphi_4 \rangle$

Possible rearrangements:
[2, 0]: $B \rightarrow \{1, 2\}$, $C \rightarrow \{1, 2\}$

The DEFT Algorithm

- ▶ Iterate over buckets and search for possible rearrangements to obtain identically ordered multisets within each bucket

A	B	$\phi_1(A, B)$	b
true	true	φ_1	[2, 0]
true	false	φ_2	[1, 1]
false	true	φ_3	[1, 1]
false	false	φ_4	[0, 2]

B	C	$\phi_2(B, C)$	b
true	true	φ_1	[2, 0]
true	false	φ_3	[1, 1]
false	true	φ_2	[1, 1]
false	false	φ_4	[0, 2]

b	$\phi_1^{\leftarrow}(b)$	$\phi_2^{\leftarrow}(b)$
[2, 0]	$\langle \varphi_1 \rangle$	$\langle \varphi_1 \rangle$
[1, 1]	$\langle \varphi_2, \varphi_3 \rangle$	$\langle \varphi_3, \varphi_2 \rangle$
[0, 2]	$\langle \varphi_4 \rangle$	$\langle \varphi_4 \rangle$

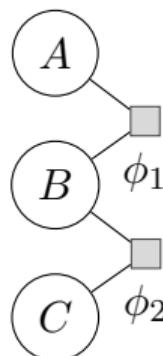

Possible rearrangements:

[2, 0]: $B \rightarrow \{1, 2\}$, $C \rightarrow \{1, 2\}$

[1, 1]: $B \rightarrow \{2\}$, $C \rightarrow \{1\}$

The DEFT Algorithm

- ▶ Iterate over buckets and search for possible rearrangements to obtain identically ordered multisets within each bucket

A	B	$\phi_1(A, B)$	b
true	true	φ_1	[2, 0]
true	false	φ_2	[1, 1]
false	true	φ_3	[1, 1]
false	false	φ_4	[0, 2]

B	C	$\phi_2(B, C)$	b
true	true	φ_1	[2, 0]
true	false	φ_3	[1, 1]
false	true	φ_2	[1, 1]
false	false	φ_4	[0, 2]

b	$\phi_1^{\leftarrow}(b)$	$\phi_2^{\leftarrow}(b)$
[2, 0]	$\langle \varphi_1 \rangle$	$\langle \varphi_1 \rangle$
[1, 1]	$\langle \varphi_2, \varphi_3 \rangle$	$\langle \varphi_3, \varphi_2 \rangle$
[0, 2]	$\langle \varphi_4 \rangle$	$\langle \varphi_4 \rangle$

Possible rearrangements:

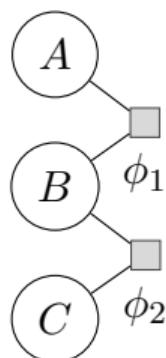

[2, 0]: $B \rightarrow \{1, 2\}$, $C \rightarrow \{1, 2\}$

[1, 1]: $B \rightarrow \{2\}$, $C \rightarrow \{1\}$

[0, 2]: $B \rightarrow \{1, 2\}$, $C \rightarrow \{1, 2\}$

The DEFT Algorithm

- ▶ Iterate over buckets and search for possible rearrangements to obtain identically ordered multisets within each bucket

A	B	$\phi_1(A, B)$	b
true	true	φ_1	[2, 0]
true	false	φ_2	[1, 1]
false	true	φ_3	[1, 1]
false	false	φ_4	[0, 2]

B	C	$\phi_2(B, C)$	b
true	true	φ_1	[2, 0]
true	false	φ_3	[1, 1]
false	true	φ_2	[1, 1]
false	false	φ_4	[0, 2]

b	$\phi_1^>(b)$	$\phi_2^>(b)$
[2, 0]	$\langle \varphi_1 \rangle$	$\langle \varphi_1 \rangle$
[1, 1]	$\langle \varphi_2, \varphi_3 \rangle$	$\langle \varphi_3, \varphi_2 \rangle$
[0, 2]	$\langle \varphi_4 \rangle$	$\langle \varphi_4 \rangle$

Possible rearrangements:

[2, 0]: $B \rightarrow \{1, 2\}$, $C \rightarrow \{1, 2\}$

[1, 1]: $B \rightarrow \{2\}$, $C \rightarrow \{1\}$

[0, 2]: $B \rightarrow \{1, 2\}$, $C \rightarrow \{1, 2\}$

Intersection: $B \rightarrow \{2\}$, $C \rightarrow \{1\}$

Theoretical Guarantees of the DEFT Algorithm

- ▶ Duplicate values in buckets increase complexity
- ▶ Degree of freedom of a bucket b :

$$\mathcal{F}(b) = \prod_{\varphi \in \text{unique}(\phi^\succ(b))} \text{count}(\phi^\succ(b), \varphi)!$$

- ▶ Degree of freedom of a factor ϕ :

$$\mathcal{F}(\phi) = \min_{b \in \{b | b \in \mathcal{B}(\phi) \wedge |\phi^\succ(b)| > 1\}} \mathcal{F}(b)$$

b	$\phi_1'^\succ(b)$	$\phi_2'^\succ(b)$
[3, 0]	$\langle \varphi_1 \rangle$	$\langle \varphi_1 \rangle$
[2, 1]	$\langle \varphi_2, \varphi_3, \varphi_5 \rangle$	$\langle \varphi_3, \varphi_5, \varphi_2 \rangle$
[1, 2]	$\langle \varphi_4, \varphi_6, \varphi_6 \rangle$	$\langle \varphi_6, \varphi_4, \varphi_6 \rangle$
[0, 3]	$\langle \varphi_7 \rangle$	$\langle \varphi_7 \rangle$

Theoretical Guarantees of the DEFT Algorithm

- ▶ Duplicate values in buckets increase complexity
- ▶ Degree of freedom of a bucket b :

$$\mathcal{F}(b) = \prod_{\varphi \in \text{unique}(\phi^\succ(b))} \text{count}(\phi^\succ(b), \varphi)!$$

- ▶ Degree of freedom of a factor ϕ :

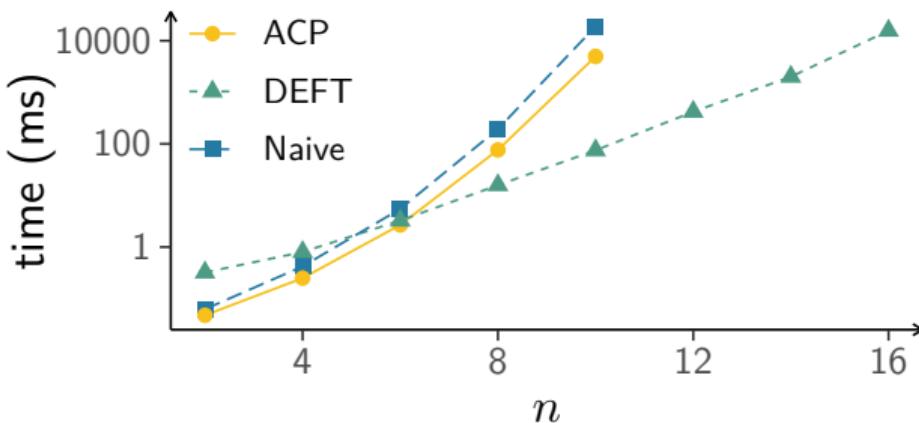

b	$\phi_1'^\succ(b)$	$\phi_2'^\succ(b)$
[3, 0]	$\langle \varphi_1 \rangle$	$\langle \varphi_1 \rangle$
[2, 1]	$\langle \varphi_2, \varphi_3, \varphi_5 \rangle$	$\langle \varphi_3, \varphi_5, \varphi_2 \rangle$
[1, 2]	$\langle \varphi_4, \varphi_6, \varphi_6 \rangle$	$\langle \varphi_6, \varphi_4, \varphi_6 \rangle$
[0, 3]	$\langle \varphi_7 \rangle$	$\langle \varphi_7 \rangle$

$$\mathcal{F}(\phi) = \min_{b \in \{b | b \in \mathcal{B}(\phi) \wedge |\phi^\succ(b)| > 1\}} \mathcal{F}(b)$$

- ▶ The number of table comparisons needed to check whether ϕ_1 and ϕ_2 are exchangeable is in $O(d)$, where $d = \min\{\mathcal{F}(\phi_1), \mathcal{F}(\phi_2)\}$ (i.e., d is factorial)
- ▶ In many practical settings it holds that $d \ll n!$
- ▶ The degree of freedom is upper-bounded by $n!$

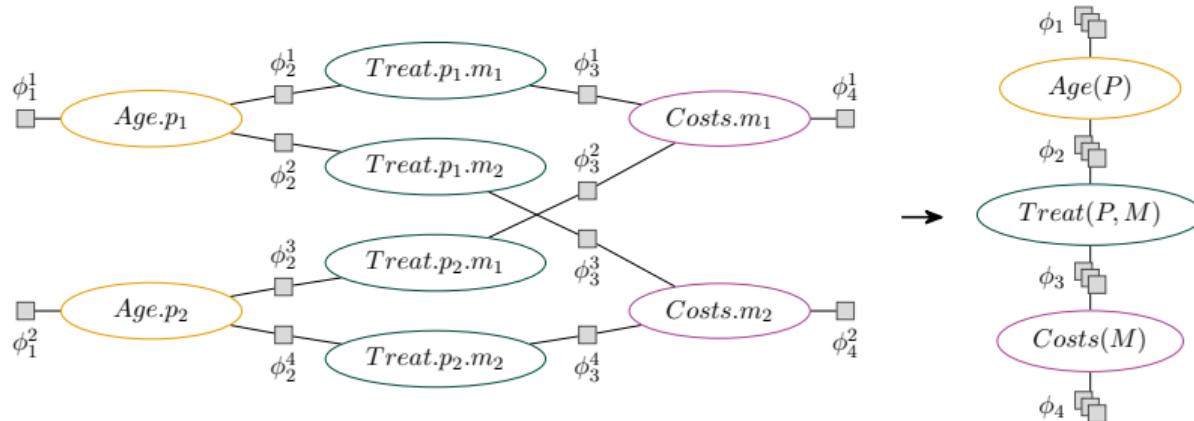

Experiments

- ▶ Comparison of run times of DEFT, ACP (previous work), and a »naive« approach
- ▶ Average over exchangeable and non-exchangeable factors with a proportion of identical potentials in $\{0.0, 0.1, 0.2, 0.5, 0.8, 0.9, 1.0\}$
- ▶ Timeout after 30 minutes per instance

Summary

- ▶ Problem of detecting exchangeable factors efficiently solved
- ▶ Upper bound on the number of table comparisons depending on the number of duplicate potential values within the buckets of the factors
- ▶ The DEFT algorithm exploits this upper bound effectively in practice
